
12. MULTIPLEXING

The MiniTrase comes standard with 6022 Multiplexer Control Board installed, therefore, your MiniTrase unit has the capability of selectively reading and/or autologging installed waveguides at many locations.

Each installed waveguide, together with its connecting cable, is referred to as a “channel”. The 6020B05 Enclosure, which handles a maximum of 76 channels, and the 6020B17 Enclosure, which handles a maximum of 256 channels are used in conjunction with any Trase unit to accomplish the multiplexing operation.
